

Savvas Bounce Pages

Starting April 1st, 2021, the BouncePages app will no longer be available on the Apple store. Users should now just open BouncePages directly from any browser (Chrome, Firefox, Safari) by following the steps below:

1. Go to bouncepages.savvasrealize.com

Savvas BouncePages

Savvas' BouncePages app enables parents, teachers and students to get more insights into concepts illustrated in the textbook by linking the homework/practice problems from the textbook to an instructional video/animation by tapping into the mobile device. BouncePages app uses augmented reality to launch engaging, interactive video animations that bring textbook pages to life.

bouncepages.savvasrealize.com

2. Aim the camera on your device so that the full page is easily viewable within the scanning window on the screen, and then tap the camera icon.
3. Wait for the scanning process to complete.
4. Once available, tap the button to view the video or animation.

When using BouncePages, the image is first uploaded with a back-end controller API. In slow connection low bandwidth environments, persistent "Matching content not found" or various timeout related messages may occur. The success or failure is largely dependent on the upload speed. Environments with less than 2 Mbps may not be reliable for the BouncePages service.

BouncePages requires access to your camera and will prompt you to allow each time, unless the browser's settings have the camera settings set to ALLOW.
